If you already have a website or are part way through designing your website and would like to utilise the Chameleon-i database functionality our iFrames are the perfect answer. Chameleon-i integration works by embedding an iFrame via a url directly into your website allowing candidates to search for a job, apply for a job and register with your agency. They provide a real-time, two-way communication between your website and Chameleon-i database.

Features of iFrame integration

Candidate registration

Job seekers can use an online registration form to register their personal details with your agency. Their details and CV are immediately available for you to view in Chameleon-i.

Job search and application

Effective job search that delivers relevant job results to job seekers visiting your website. The search criteria includes location, job type and sector. Registered job seekers can use the one-click application feature.

Auto responders

Once registered the job seeker will receive a 'registration confirmation' e-mail with a user name and password enabling them to return and update their details.

Alerts to consultants

The alert system within Chameleon-i will notify designated consultants of new candidate registrations. Candidate applications made via the website are automatically short listed and the managing recruitment consultant notified.

Password Reminder

If candidates forget their passwords no problem! The password reminder will automatically send them an e-mail containing their user details.

RSS feed

RSS feeds help to drive more targeted traffic to your website, working positively towards an increased website visibility. Linked within Chameleon-i the RSS provides instant publication of your jobs, you can also use the RSS feed to post your vacancies to your social media pages.

Reporting

The dashboard within Chameleon-i displays an at-a-glance report that details the number of registrations and applications that have been made via your website.

* Chameleon-i connectivity module includes all real time database connections and support.

Integrated iFrames Kit £499.00 +VAT Per kit £50.00 per month connectivity module*

This form shows you what fields and forms will be integrated into your website. iFrames 1-4 load in a logical sequence taking the candidate through a step by step journey from search to application.

Defensive Full Back

Reference: DE00005
Location: UK - North
Salary: £1,000,000 pa
Work Type: Permanent

About the Company:

The full-backs take up the holding wide positions and traditionally stayed in defence at all times, until a set-piece. Modern full-backs take a more attacking role, overlapping with wingers down the flank. There is one full-back on each side of the field. The traditional English full-back was a large, strong man who would make substantial use of "hacking" – deliberately kicking the shins of opponents, a practice that was accepted as legal in Britain but not in other countries, and caused major controversy as the game became increasingly internationalised from the 1950s on. It is now effectively banned everywhere, and it is this in part that has given rise to a different set of defensive roles.

In the modern game, full-backs have taken on a more attacking role than is the case traditionally. Wingerless formations, such as the diamond 4-4-2 formation, demand the full-back to cover considerable ground up and down the flank. Some of the responsibilities of modern full-backs include:

Provide a physical obstruction to opposition attacking players by shepherding them towards an area where they exert less influence. They may manoeuvre in a fashion that causes the opponent to cut in towards the centre-back or defensive midfielder with his weaker foot, where he is likely to be dispossessed. Otherwise, jockeying and smart positioning may simply pin back a winger in an area where he is less likely to exert influence. Making off-the-ball runs into spaces down the channels and supplying crosses into the opposing penalty box.

Implementation of iFrames

Our team will create your iFrames ready for styling by your website developer. We will provide your website developer with the iFrames and log-in details to your unique Content Management System (CMS). Through the CMS it is possible to specify main font, colour, size and the H1 Tag, H2 Tag, Body, P, a:link, Button and Button roll over. You can also use the CMS to specify the hexadecimal code for the background of the search results.

To power the Job Search element of the iFrames you will need to specify to us what criteria you would like displaying. Location Search either powered by tags set within Chameleon-i or default from the location set on the vacancy. Please also specify if terms are required.

iFrames Specification

We will build your iFrames to your specification outlined in this form.
